Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

In a file management system, users are required to provide a valid file name when creating new files. The system enforces specific rules for file names to maintain consistency and avoid potential issues. Your task is to implement a Java program named FileNameValidator that takes user input for a file name and validates it according to the specified rules.

Rules for Valid File Name:

The file name must consist of alphanumeric characters (letters and digits) only. The file name must have a minimum length of 3 characters.

Implement a custom exception, FileNameValidator, to handle cases where the entered filename does not meet the specified criteria.

Input Format

The input consists of a string S, representing the desired filename.

Output Format

The output is displayed in the following format:

If the entered file name meets the specified criteria, the program outputs

"Valid file name"

If the entered file name does not meet the criteria and triggers the `InvalidFileNameException`, the program outputs

"Error: Invalid file name. It must be alphanumeric and have a minimum length of 3 characters."

Refer to the sample output for formatting specifications.

Sample Test Case

Input: myfile123

Output: Valid file name

Answer

```
// You are using Java
import java.util.Scanner;
```

```
class InvalidFileNameException extends Exception {
    public InvalidFileNameException(String message) {
        super(message);
    }
}
```

```
public class Main {
```

```
    public static void validateFileName(String filename) throws
    InvalidFileNameException {
```

```
        String errorMessage = "Error: Invalid file name. It must be alphanumeric and
        have a minimum length of 3 characters.";
```

```
        if (filename.length() < 3) {
```

```
        throw new InvalidFileNameException(errorMessage);
    }

    for (int i = 0; i < filename.length(); i++) {
        char c = filename.charAt(i);
        if (!Character.isLetterOrDigit(c)) {
            throw new InvalidFileNameException(errorMessage);
        }
    }
}

public static void main(String[] args) {
    Scanner sc = new Scanner(System.in);
    String filename = sc.nextLine();

    try {
        validateFileName(filename);
        System.out.println("Valid file name");
    } catch (InvalidFileNameException e) {
        System.out.println(e.getMessage());
    }
}
```

Status : Correct

Marks : 10/10
